GRASS AND LEGUMES IMPROVE THE ROTATION

Conserve Soil and Increase Returns

Alfalfa-grass mixtures in rotations provide excellent summer pasture and high quality winter feed. There is no soil washing on this slope

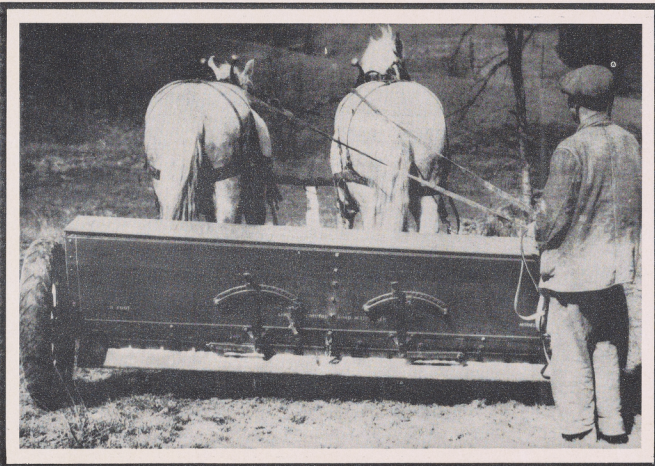

Sweet clover in rotation supplies plentiful spring and early summer pasture. As a green manure, it restores organic matter to the soil

Sudan grass serves as a supplemental pasture during the late summer and early fall. It permits a reduction in the grazing of permanent pastures during late summer

Pastures of bluegrass and white clover provide the bulk of the pasture in spring and fall. There is no erosion problem in this field

The application of lime is frequently necessary to secure good stands of desirable grasses and legumes for both hay and pasture

Liberal applications of fertilizers quickly return the total investment through increased quantity and quality of desirable forage crops

A CAREFULLY PLANNED PASTURE PROGRAM IS JUST AS IMPORTANT AS A CROP ROTATION PROGRAM. SAVE SOIL BY GIVING PASTURE THE ATTENTION IT DESERVES
